FORENSIC REPORT

Forensic Analysis - Metallic Gold Dust

Sample ID	GF-DUST-23-06-A
Recovered from	Floor near side-room body position
Comparison samples	Pyrotechnic residue, event ribbon coating, decorative marking tape

Microscopic and chemical comparison does not support pyrotechnic residue as the source of the gold particles. The sample contains a polymer-based metallic coating with aluminium-bronze pigment and adhesive binder.

The closest comparison is LuxEvent Secure event ribbon / marking tape used to label service routes and equipment containers during the celebration setup.

Conclusion

The trace links the scene to the event supply chain rather than to fallout from the fireworks crowd.
